

GD Analyst test

Brief

Currently, HDR is not available in our game. The goal of this feature is to introduce HDR support across multiple platforms and ensure players can enable or disable it through the interface as outlined in the design document. As part of this assignment, please **identify the main areas that need to be tested, outline dependencies and potential risks, and, if possible, include platform-specific requirements** (e.g., PlayStation TRCs, Xbox XRs, Windows HDR).

Your Task

1. Review the GD Document

- Carefully read the feature description and functional notes.

2. Propose a QA Approach

- From the information in the document, identify what *you* believe should be tested.
- Decide which areas are most important and why.
- Suggest how you would structure testing across different platforms (PC, PlayStation, Xbox, OSX).

3. Create Deliverables

- Draft a **Testing Map** outlining the main focus areas and your reasoning.
- From this plan, create a **Checklist** that QA could follow when the feature is ready.
- Please use google docs to compile your document and send us the link

4. Time Estimate

- Please indicate approximately how much time you spent preparing your answer.

GD document

Description

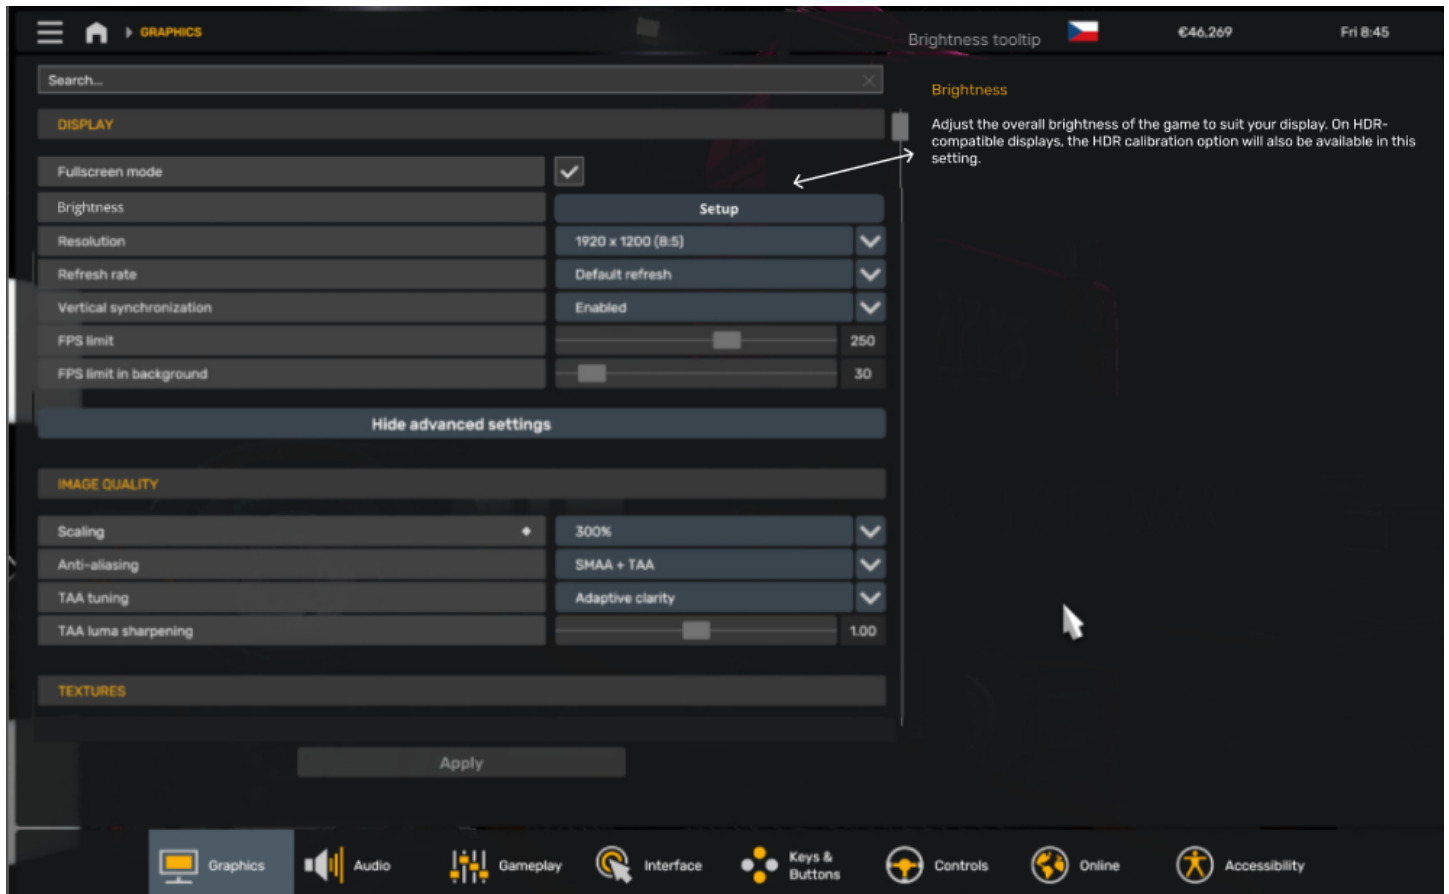

HDR (High Dynamic Range) is a feature for video quality optimization. If a player is using a monitor or TV that supports HDR, we want to give them the option to calibrate the video quality in game at any time.

HDR goes hand in hand with Brightness setup, which currently is not optimal in our games (it works, but you can't see in UI that it works, it seems like it's doing nothing), that will be changing as well.

Functional notes

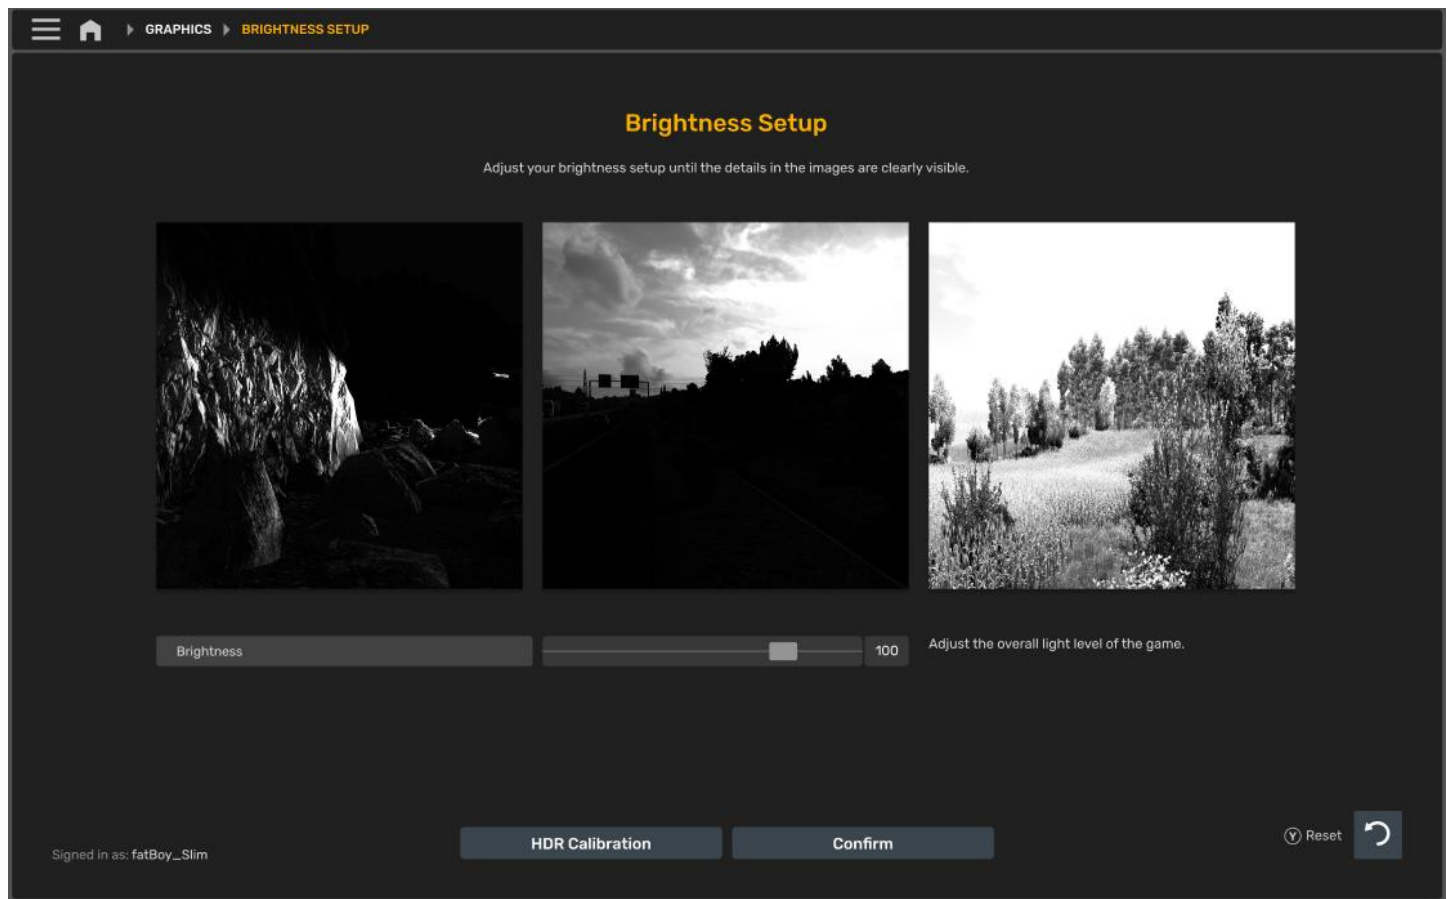

Options - Brightness

- Brightness setting in Options will now have a “Setup” button instead of slider, if pressed, new screen Brightness Setup will appear

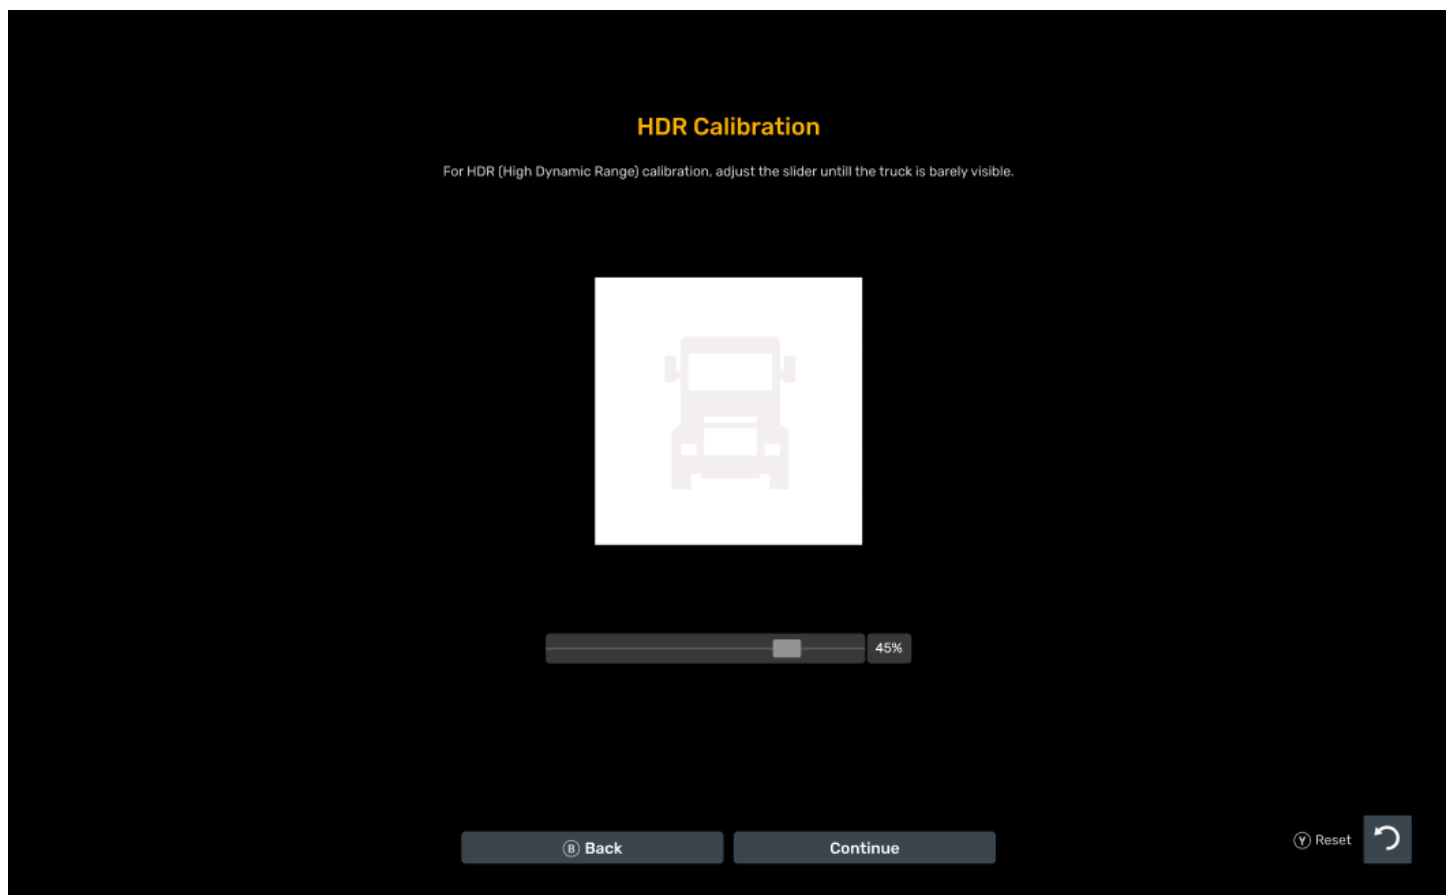

Brightness Setup

- Brightness Setup screen -
 - 3 pictures from game where you'll see your brightness and hdr adjustments
 - 1 slider for brightness
 - Next to sliders is a textbox with explanation
 - 3 buttons:
 - HDR Calibration - enabled only when player is using HDR supported display, if pressed - 2 new screens of HDR Calibration will follow
 - Confirm
 - Reset - visual on the side, resets values to default

HDR Calibration

- HDR Calibration screens -
 - 2 simple screens without windows, black background, same visuals, only thing that will be different is the picture with the truck icon, one needs to be white, second black

HDR Calibration

For HDR (High Dynamic Range) calibration, adjust the slider until the truck is barely visible.

Platforms

Platforms we target the release for

- **PC / Steam** (Windows HDR)
- **PlayStation 5**
- **Xbox Series X**
- **OSX**
